Towards closed-loop wind farm control under time-varying inflow conditions

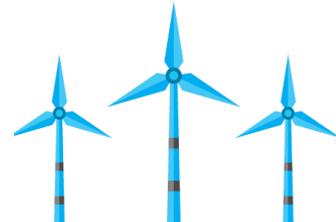

A yaw-based wake steering solution leveraging FLORIS

Wind Energy Systems Engineering, Pamplona, Spain.

October 2, 2019

Bart Doekemeijer and Jan-Willem van Wingerden
Delft University of Technology

Introduction

The issue of wake formation in wind farms

"... estimated total wind farm wake losses of **10% to 23%** for several offshore wind farms"¹

- Increased power production
- Increased turbine lifetimes
- Integration with the electricity grid

greedy control

Controller synthesis

And a bunch of extra stuff...

- Wind direction **bias** and **drift detection** (turbine side)
- Appropriate **time averaging** for the yaw angles, power signals, and SCADA measurements
- A flag whether a **steady-state** situation has arrived
- A flag whether there is sufficient **observability** over the specified time window
- A **robust optimization** method accounting for wind direction variability
- **Smoothing** between optimal yaw angles to reduce sensitivity to the estimated wind direction, wind speed and turbulence intensity

Systems and Control

Conclusion and outlook

What did we do and what's next?

- FLORIS-based wind farm controller **survived stress-test**
 - An increase of up to **+10%** in instantaneous **energy yield**
 - An increase in **yaw actuator duty cycle** of up to **+35%**
-
- Reducing the **conservatism** in the control solution
 - Experimental **validation**
 - (Re)exploring a **dynamic FLORIS**
